

Chart Feature Market Expectations

Collected community evidence and current public research

Counting note

This answers the nine requested questions using the collected Reddit, community, YouTube and TradingView records, plus current public web research. The analysis starts from the full collected corpus and then normalises chart-related discussions; it is not limited to a fixed search-keyword list. A **record** is one collected post, reply, review, video or TradingView idea after de-duplication. It is not a unique person or a vote. **Comments** are shown only where the source exposed a comment count. The TradingView feed is primarily published ideas, so it is not a complete census of TradingView comments or private communities.

1. What do people like and dislike about TradingView communities?

What people like

- **A chart that can become the trading workspace.** The positive language is around fast chart-to-order actions, visible stop-loss/target, drawing tools, indicators and not having to switch screens.
- **Choice and control.** Users value extensive indicators, custom scripts, saved layouts, multiple charts and the ability to tune the workspace to their own setup.
- **Discovery and learning.** Trading ideas, chart examples, custom indicators and shared setups help users understand an instrument before taking a trade.
- **Mobile simplicity when it does not remove power.** Users praise clean, responsive chart flows more than dense terminals. The preference is not “fewer features”; it is “the right feature at the point of decision.”

What people dislike

- **A broken analysis-to-execution flow.** The strongest product frustration is analysing on one chart, then opening another surface to add or change SL, target, trailing stop or exit.
- **Reliability uncertainty during a trade.** Lag, stale updates, slow load and price differences are repeatedly discussed because they make the chart unreliable precisely when a user must act.
- **Missing workflow details, not just missing indicators.** Users call out layout synchronisation, watchlist organisation, drawing persistence, custom scripts and visible risk amounts. These look small individually, but interrupt daily usage.
- **Clutter and forced workarounds.** Advanced users want control over what is shown; beginners want the platform to explain the chart rather than force them to assemble it manually.

Chart product implication: the market does not reward a long indicator catalogue by itself. It rewards a dependable, personalised chart workflow that carries context, risk and execution together.

2. What are people saying about Groww Chart, Dhan Chart and Sahi Chart?

Product	Direct chart-corpus mentions	What users like	What users are dissatisfied with	What it means for chart product design
Groww	99	Simple mobile experience; chart-based trading and an easy entry point for less technical users.	Community discussions raise peak-time lag, chart/price confidence and limits for very active workflows.	A fast, simple default is valuable, but active users quickly judge it on reliability and depth.
Dhan	634	Strong awareness of TradingView integration, advanced options context and a feature-forward platform.	High-signal community requests focus on sync across layouts, OI in the chart, custom Pine support, and active-trade SL/target value visibility.	Integration completeness matters: a recognised TradingView brand does not remove the need to finish broker-specific chart workflows.
Sahi	74	Chart-first and scalper positioning; in-house charting, indicators, OI-on-chart and direct execution are visible in public material.	The public user sample is much smaller, so claims about broad preference cannot be made. Its 5-second/scalper capability is clearer in product material than in independent community discussion.	Sahi is a useful benchmark for fast decision flows, but product claims must be validated with a larger neutral user sample.

Important distinction: Groww, Dhan and Sahi pages can describe what the company offers. They do not prove that users broadly prefer it. Community discussions are used here to identify the jobs and pain points, not to declare a winner.

3. Which indicators are discussed most often?

The ranking uses the de-duplicated TradingView feed only. It measures explicit text mentions, not quality or trading effectiveness. “Market structure” and “support/resistance” are chart-analysis concepts, included because they are discussed alongside indicators.

Rank	Indicator or chart-analysis concept	Mentions
1	EMA	5,753
2	SMA	1,594
3	RSI	1,528
4	Market structure	1,312
5	Moving average	883
6	Fibonacci	680
7	MACD	398
8	Support and resistance	366
9	Order block	300
10	PCR	261
11	VWAP	186
12	Open interest	157
13	Bollinger Bands	128
14	Volume Profile	103
15	Ichimoku	86
16	ATR	74
17	ADX	64

Rank	Indicator or chart-analysis concept	Mentions
18	RSI Divergence	51
19	Supertrend	44
20	Implied Volatility	36
21	Stochastic	29
22	Pivot Points	18
23	Max Pain	12
24	Greeks	11
25	UT Bot	6
26	Volume Delta	5
27	AVWAP	4
28	RRG	4
29	Chandelier Exit	2

What this says: baseline trend and momentum tools dominate discussion. The next meaningful layer is decision context: support/resistance, volume, OI, IV and risk. A chart product should make common workflows effortless before adding a very long tail of niche studies.

4. What exactly are people asking for on TradingView and broker charts?

- 1. Execute and manage from the chart:** entry, SL, target, trailing SL, modification and exit without app switching.
- 2. See rupee risk and reward while the position is live:** not only quantity or price levels.
- 3. Persist the workspace:** saved layouts, drawings, indicator templates, watchlist sections and settings.
- 4. Synchronise multi-chart analysis:** symbols, timeframe, drawings and templates across layouts or monitors.
- 5. Use their own analysis:** custom indicators/Pine support, an indicator library and clear favourites/template controls.
- 6. Get Indian options context on the chart:** OI/OI Profile, bid/ask, IV, Greeks, PCR, volume and liquidity instead of opening a separate tool.
- 7. Trust the chart under pressure:** fast load, live candles, transparent adjustment rules and a clear explanation when prices differ.
- 8. Turn analysis into a repeatable workflow:** alerts, alert debugging, replay/backtesting, scanners and risk-based position sizing.
- 9. Avoid a one-size-fits-all screen:** a beginner wants a guided view; an active trader wants a dense, controllable workstation.

5. What are the daily and monthly TradingView community counts?

The available TradingView source is a public **ideas feed**, not a complete community-thread/comment API. Therefore the reliable count is published idea records collected on each run, not “all daily community threads.”

Period	Feed captures	Published idea records captured	Useful interpretation
22 July 2026	1 catch-up capture	11,543	Initial historical catch-up. Do not compare this one day with later daily runs.
23-31 July 2026	9 daily captures	1,241	Average 138 ideas per capture.
July 2026 total	10 captures	12,784	Includes the initial catch-up.
1-17 and 27 August 2026	18 daily captures	2,511	Average 140 ideas per capture.
Full covered period	28 captures	15,295 raw captured records; 13,631 unique ideas after de-duplication	Best available volume measure for this source.

There is no defensible daily/monthly count of all TradingView comments or all people engaging from this dataset. Treat the numbers as **collection coverage and public idea volume**, not a user-base estimate.

6. How many records mention TradingView, TradingView communities, Groww Chart, Sahi Chart and Dhan Chart?

Reference	Direct mentions in chart-related corpus	Reading it correctly
TradingView	608	Records explicitly naming TradingView.
TradingView public idea feed	13,631 unique ideas	Community-content records collected from the public feed, whether or not they explicitly say "TradingView."
Groww	99	Brand-level mentions in chart-relevant records. Exact phrase "Groww Charts" appears only once, so use the brand count rather than pretending phrase usage is complete.
Dhan	634	Brand-level mentions in chart-relevant records. Exact phrase "Dhan Chart" appears 42 times.
Sahi	74	Brand-level mentions in chart-relevant records. Exact phrase "Sahi Chart" does not appear in the captured text, so do not read this as no discussion of Sahi charting.
"5 second" / "5-second"	11 combined, before brand attribution	The captured text is too small and ambiguous to claim a community demand number specifically for Sahi 5-second charts.

These are record mentions, not people. One author can create multiple records, and one record can mention several products.

7. What are the 50 most discussed chart features or discussions, including frequency, comments and thread length?

The table uses 15,767 de-duplicated chart-related records. "Visible comments" is the sum exposed by sources that publish it. "Average words" uses the title and first part of the source text; it is a discussion-depth proxy, not the true length of every thread. The labels are intentionally mutually distinct so the same topic is not repeated under several names.

Rank	Feature or discussion	Records	Visible comments	Avg. words
1	EMA	6,314	22,618	231
2	Stop-loss and target	2,692	4,559	203
3	Trendlines	2,214	3,160	200

Rank	Feature or discussion	Records	Visible comments	Avg. words
4	Bid/ask and liquidity	2,210	5,258	243
5	Price action	2,148	6,327	242
6	Momentum oscillators	2,077	14,790	224
7	SMA	1,929	22,431	252
8	Risk position sizing	1,185	4,272	232
9	Chart speed / loading	1,148	7,969	250
10	Fibonacci tools	855	3,641	254
11	Mobile chart usability	560	8,569	267
12	Volatility indicators	441	4,647	258
13	Support/resistance	409	3,869	223
14	Portfolio on chart	383	6,067	244
15	Replay / backtesting	371	4,390	191
16	Volume profile / order flow	338	807	271
17	Options chain	305	10,003	217
18	Screeners / scans	267	17,109	225
19	Volume indicators	255	2,371	262
20	Watchlist sections / colour coding	243	3,425	199
21	OI on chart / OI profile	234	6,181	155
22	Market / index overview	232	1,398	240
23	Candlesticks	214	1,085	244
24	Risk-reward / payoff	187	897	156
25	Data accuracy / mismatched prices	174	907	243
26	IV / Greeks	165	4,413	191
27	Price / indicator alerts	161	11,875	244
28	Chart patterns / auto-detection	160	458	187
29	Trailing stop	118	728	215
30	Historical / intraday data	108	964	218
31	Chart sharing / ideas	100	613	217
32	Seconds / scalper charts	99	2,804	235
33	Strategy signals	75	382	204
34	Options data on chart	48	440	186
35	Alert debugging	40	405	238
36	Chart customisation	37	1,084	285
37	Chart webhooks	35	140	228
38	AI chart assistance	30	1,698	228
39	Trade execution speed	30	208	179
40	Saved indicator templates	29	1,899	278
41	Custom indicators / Pine Script	26	1,206	239
42	Multi-chart layouts	19	533	224
43	Drawing tools	12	61	220
44	Heatmap	10	85	250

Rank	Feature or discussion	Records	Visible comments	Avg. words
45	Layout / chart synchronisation	10	5	232
46	Trade journal / performance	9	3	245
47	Chart-to-order	6	2	229
48	Indicator management	2	0	232
49	Pop-out charts	2	0	266
50	Multiple monitors	1	29	290

What users like and dislike within these discussions

- **Liked in words:** clean, simple, fast, smooth, useful, easy, direct and customisable. These are attached most often to mobile usability, chart tools, common indicators, saved workspaces and fast chart-to-order flows.
- **Disliked in words:** lag, loading, stale, mismatch, blank, clunky, missing, confusing and frustrating. These are attached most strongly to chart reliability, price confidence and the need to leave the chart to manage a live order.
- **The product lesson:** popularity of EMA/RSI/price action is not a feature request to add more studies. The more actionable demand is to let users save, understand, apply and act on the studies already on screen.

8. Are people discussing Sahi 5-second charts?

There is **no sufficient independent community volume in the collected corpus to quantify demand for “Sahi 5-second charts.”** The corpus contains 11 generic “5 second” or “5-second” references, but they cannot reliably be attributed to Sahi and may refer to other timeframes or products.

Sahi publicly presents a scalper/seconds-level chart capability. That confirms availability, not user demand. The correct conclusion is: **do not use 5-second charts as a community-validated headline yet; treat it as a differentiator to test with high-frequency options and scalping users.**

9. How many people are talking about loading issues?

There are **643 unique chart-related records** containing one or more reliability/performance terms. The terms overlap, so they should not be added together.

Reliability phrase	Records
Lag	423
Loading	99
Stale	65
Delayed	55
Freeze	20
Blank chart	0
“Graph not moving”	0
Price mismatch	0
Price differs	0

The zeroes mean the exact phrase did not appear in the collected text, not that the problem does not exist. Manual web research shows the same pain is often described as *prices not moving*, *chart not loading*, *mismatch*, *wrong candle* or *9:15 lag*. The product requirement is a single reliability layer: visible connection/data state, transparent chart-adjustment rules and an easy incident path when chart price and

execution/position price appear different.
