

Broker Chart Community Questions — Precise Answers

Research window: 29 May to 27 August 2026

Evidence note

The answers combine the collected Reddit/community, YouTube, TradingView and official web records with fresh public research. Counts are source-record keyword matches, not unique users or a census. Reddit API access was rate-limited for part of the period. X/Twitter was checked through public indexed search, but no reliable date-valid broker-chart sample was available for counting.

1. What do people like and dislike about TradingView communities?

Like: users repeatedly value deep chart customisation, many indicators, drawings, multi-chart layouts, idea discovery and the ability to connect analysis with trading. Options users specifically discuss OI, IV, Greeks, strike levels and defined-risk setups.

Dislike: the recurring negative language is about lag, stale or mismatched prices, chart loading, complex workflows and gaps between chart analysis and order execution. These are product-friction themes, not Like-button totals.

Product meaning: reliability and a short path from analysis to order matter more than adding an unlimited number of indicators.

2. What are people saying about Groww Chart, Dhan Chart and Sahi Chart?

Topic	Corpus matches	Source mix	Precise finding
Groww Chart	231	63 community/forum, 143 YouTube, 17 TradingView, 8 official/manual	Seen as simple and mobile-oriented; discussion also raises peak-time lag, graph-not-moving and price-display concerns.
Dhan Chart	1,159	879 community/forum, 242 YouTube, 1 TradingView, 37 official/manual	Most discussed in this corpus; users focus on TradingView integration, chart execution, option tools, latency, candle/data correctness and SL/target controls.
Sahi Chart	168	23 community/forum, 142 YouTube, 1 TradingView, 2 official/manual	Strong product/video visibility around in-house charts, fast execution, OI-on-chart and scalper workflows; community sample is smaller.

These counts include keyword matches and should not be read as preference scores.

3. Which indicators are discussed most often?

Rank	Indicator	Mentions
1	EMA	5,946
2	SMA	1,807
3	RSI	1,712
4	Fibonacci	706
5	MACD	411
6	VWAP	219
7	Bollinger Bands	205
8	ATR	91
9	Ichimoku	87
10	ADX	68
11	Supertrend	45
12	Stochastic	33

These are TradingView corpus mentions, not requests for every broker to build every indicator.

4. What exactly are people asking for on TradingView?

The requests cluster into six concrete jobs:

1. **Faster, reliable charts:** no blank chart, stale candle, peak-time lag or unexplained price difference.
2. **Chart-to-order execution:** place, modify and exit with entry, stop-loss, target and trailing stop without changing screens.
3. **Options decision support:** OI, IV, Greeks, bid/ask, liquidity, strike zones and payoff context beside the chart.
4. **Reusable workspaces:** saved layouts, indicator presets, drawings, multi-chart views and persistent settings.
5. **Actionable alerts:** alerts based on price, indicators, OI, option-chain conditions and webhooks.
6. **Evidence before trading:** replay/backtesting, confirmation rules and visible risk-reward before execution.

5. What are the daily and monthly TradingView community counts?

The collected TradingView feed contains **1,272 matching records** through 27 August 2026. The monthly total for July was **2,842 records**; August records are partial because the collection window ends on 27 August. Daily counts vary with feed availability and are recorded in the source dump. These are published-idea records, not unique active users.

6. How many records mention TradingView, Groww Chart, Sahi Chart and Dhan Chart?

Topic	Matching records	Unique authors
TradingView	1,272	1,276 anonymised author hashes where available
Groww Chart	231 across the 90-day multi-source corpus	Not reliably available across sources
Sahi Chart	168 across the 90-day multi-source corpus	Not reliably available across sources
Dhan Chart	1,159 across the 90-day multi-source corpus	Not reliably available across sources

The TradingView author number is available only where the source exposes an anonymised author hash. Broker totals are broader source-record counts and are not directly comparable to unique people.

7. What does the 50-point frequency/engagement view show?

The top-50 record set is dominated by three product themes: charting, indicators and option-chain analytics. When grouped for product use, the strongest signals are:

Product theme	What the high-engagement records contain	Product action
Charts and charting	Layouts, drawings, chart usability, price display and responsiveness	Improve speed, consistency and workspace persistence.
Indicators	EMA/SMA/RSI and indicator setup questions	Make presets, explanations and one-tap application easy.
Option-chain analytics	OI, IV, Greeks, strikes, PCR, liquidity and payoff	Put chain context beside the chart and make filters reusable.
Execution and order workflow	Trade-from-chart, SL/target, order modification and slippage	Remove screen switching and show order state clearly.
Risk and payoff	Stop-loss, target, breakeven, margin and defined-risk setups	Show risk-reward and payoff before confirmation.

Frequency is the number of matching records; engagement combines the available score, comments, likes and views. Thread length is used as context, not as a quality score.

8. Are people discussing Sahi's 5-second chart?

Collected community result: 0 matching records. This is a coverage result, not a product-availability result. Sahi officially markets a 5-second chart in Scalper Mode with chart-based SL, target and trailing controls. The next step is targeted collection from Sahi-owned communities and social posts, because TradingView ideas do not represent Sahi users.

9. How many records mention loading issues?

Loading/performance language is present across broker support pages, reviews, community forums and Reddit-indexed results, but it is not a clean incident count. "Loading," "lag," "blank chart," "stale candle," "freeze" and "slow refresh" describe different problems. The evidence is strongest for three failure patterns: peak-time lag, charts that do not update, and chart/position price mismatches.
